

Case Study

Goetre Uchaf features a stunning collection of three and four-bedroom homes from Redrow's award-winning Heritage Collection.

The development enjoys a superb location on the outskirts of Bangor, away from the hustle and bustle of the busy North Wales City.

In late 2015, having started work on site with an alternative Waste Water Heat Recovery (WWHR) manufacturer, Redrow decided to enlist the services of Power-Pipe and group technical manager, Jonathan Moss, explains why:

"Quite early on into the project we encountered problems with the installation of our WWHR systems which is why we decided to switch to Power-Pipe.

"The team were quickly able to assist us with all the technical queries we had regarding the compliance of the installation. Power-Pipe was also the only system we came across where 22mm water connections came as standard, which made them much easier to integrate into the homes.

Moss added: *"As well as these practical considerations, the units were cost-effective and offered a generous SAP uplift which helped to achieve building regulations with certain house types on the Goetre Uchaf development."*

Power-Pipe R2-84 installed at Redrow's Goetre Uchaf development in Bangor

Update

Following on from the success of using Power-Pipe at its Goetre Ucahf site, Redrow has now added its innovative systems to its national trade specification.

This means Power-Pipe is featured on the developer's approved supplier list for Waste Water Heat Recovery and can be specified by various Redrow divisions across the UK.

Speaking about the partnership, Ashley Prescott, director at Power-Pipe UK, said:

"Teaming with Redrow is a major step for our business and will allow our systems to get valuable recognition across the industry for its cost-effective energy efficiency performance."
